(STIC)

Please search the following:

- 1. SEQ ID NO:3-4.
- 2. oligo search of SEQ ID NO:3-4.

Please search both commercial and patent databases (including pending). Thanks

Medina A. Ibrahim Patent Examiner GAU:1638 CM1-9E03 mailbox-9E12 (703)306-5822

                                                                                                                                                                                                                                                                                                                                                                                            and UI-R-El libraries. The UI-R-Al library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, and muscle. The UI-R-El library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CO) was constructed as follows: PCR amplified CDNA inserts from a pool of UI-R-Al and UI-R-El clones from which 3' ESTs had been derived was used as a driver in a hybridization with the pooled UI-R-Al and UI-R-El library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-CO library. This procedure has been previously described
                                                                                                                                                                                                                                                                                                                              þ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0 0 0 0 0 0 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB

CC The nucleic acid encoding the chelon protein is useful for binding cd divalent mercuric ions, to take up, sequester and concentrate the heavy containing the chelon protein is useful for binding containing the chelon for the invention, when capable onto a solid support, is useful for concentrating heavy metal ions from contaminated environment waste streams or contaminated capacity expressed in enteric bacteria (which are nontoxigenic and compathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in vivo sequestration and conclusts of the invention are also useful in water treatment resins. CC molecules of the invention are also useful in water treatment resins. CC molecules of the invention are also useful in water treatment resins. CC invention. This sequence is one of the water chelon variant protein of the carmed chelons of the invention. Merk chelon variant protein of the carmed chelons of the invention acids 1-107 of this proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which binds mercuric ions. The invention is useful for recombinantly colors are producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding cd divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when claims from contaminated environment waste streams or contaminated aqueous medium including biological fluids. The nucleic acid, when recombinantly expressed in enteric bacteria (which are nontoxigenic and nonpathogenic), is suitable for use in the in vivo sequestration and celimination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The nucleic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present amino caid sequence represents one of a collection (AAU97553-AAU97560) of synthetic cadmium/mercury ion binding chelon proteins of the invention. This sequence is one of the heavy metal binding proteins termed chelons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

cell capable of expressing a chelon coding sequence with a vector cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing the recombinant host cell inder conditions, where DNA is expressed.

CC The nucleic acid encoding the chelon protein is useful for binding cell ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when cell inmobilised onto a solid support, is useful for concentrate the heavy introduced in the invention and cell inmobilised onto a solid support, is useful for concentrating heavy metal cell inmobilised onto a solid support, is useful for concentrating heavy metal cell inmobilised onto a solid support, is useful for concentrating heavy metal cell inmobilised onto a solid support, is useful for concentrating heavy metal cell inmobilised onto a solid support, waste streams or contaminated cell inmobilised onto a solid support, waste streams or contaminated cell inmobilised onto a solid support, waste streams or contaminated cell instance of a cell provided in the invite streams or contaminated cell instance of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cell instance represents one of a collection (AAU9753-AAU9756) of acid sequence represents one of a collection (AAU9753-AAU9756) of the invention.

CC of this sequence is one of the heavy metal binding proteins termed chelons cell in the invention of the heavy metal binding proteins termed chelons.
                                                                                                                                                                                                                                                                                                                                                                                         В

The invention is useful for binds mercuric lons, the invention is a protein in a host-cell, by infecting or transforming a host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing creaming the chelon protein is useful for binding containing the containing heavy metal containing to a solid support, is useful for concentrating heavy metal containing the containing heavy metal consistency, is suitable for use in the in vivo sequestration and containing the containing biological fluids. The nucleic acid, when are encombinantly expressed in enteric bacteria (which are nontoxigenic and containing to to toxic metal ions such as mercury and/or cadmium. The humans exposed to toxic metal ions such as mercury and/or cadmium. The nucleic acid of the invention are also useful in water treatment resins.

The nucleic acid of the invention is highly specific and binds divalent contains such as mercury and/or cadmium. The nucleic acid of the invention is highly specific and binds divalent the invention are also useful in water treatment resins.

The nucleic acid of the invention is highly specific and binds divalent as mercury or cadmium with high affinity. The present amino cation such as mercury ion binding chelon proteins of the invention.

The invention of the heavy metal binding proteins termed chelons of the invention.
                                                                                                                                                                                                                                                                                                                            В

                                                                                                                                                                                                                                                                                                                                                                                                                      CC which binds mercuric ions. The invention is useful for recombinantly CC producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector CC comprising a promoter active in the host cell operably linked to a coding CC region for the protein to produce a recombinant host cell and culturing CC region for the coding the chelon protein is useful for binding CC The nucleic acid encoding the chelon protein is useful for binding CC metal ions from contaminated soil, ground water, hydroponic solutions or immobilised onto a solid support, is useful for concentrate the heavy in immobilised onto a solid support, is useful for concentrating heavy metal care and environment waste streams or contaminated concentrating heavy metal care recombinantly expressed in enteric bacteria (which are nontoxigenic) and concentration of mercuric ion from gastrointestinal tracts of animals or contaminated to toxic metal ions such as mercury and/or cadmium. The cation such as mercury or cadmium with high affinity. The present amino contaminate acid of the invention is highly specific and binds divalent cation of the heavy ion binding chelon proteins of the invention.

The presents one of the heavy metal binding ordinals termed chelons.
                                                                                                                                                                                                                                                                                                                                      Query Match

                                                      of the invention
                                                            This sequence is one of the heavy metal binding proteins termed chelons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which blinds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding the chelon protein is useful for binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4; Page 22; 42pp; English.

                                                                                                                                                                                                                                    The nucleic acid encoding the chelon protein is useful for binding contained in the contained and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when commobilised onto a solld support, is useful for concentrating heavy metal consistency may be a solid support, is useful for concentrating heavy metal consistency may be a solid support, is useful for concentrating heavy metal consistency may be a solid support, is useful for concentrating heavy metal consistency may be a solid support, is useful for concentrating heavy metal consistency may be a solid support, is useful for concentrating heavy metal consistency may be a support of metal consistency is suitable for use in the in vivo sequestration and constant of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The consistency metal is sufficient treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present amino contains such as mercury or cadmium with high affinity. The present amino contains such as mercury or cadmium with high affinity. The present amino contains sequence is one of the heavy metal binding proteins of the invention.
                                                                                      Matches
                                                                                                                             Query Match

CC producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector CC comprising a promoter active in the host cell operably linked to a coding CC region for the protein to produce a recombinant host cell and culturing CC the recombinant host cell under conditions, where DNA is expressed. CC The nucleic acid encoding the chelon protein is useful for binding CC divalent mercuric ions, to take up, sequester and concentrate the heavy CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC insofting contaminated environment waste streams or contaminated CC ions from contaminated environment waste streams or contaminated CC aqueous medium including biological fluids. The nucleic acid, when CC elimination of mercuric ion from gastrointestinal tracts of animals or CC humans exposed to toxic metal ions such as mercury and/or cadmium. The CC humans exposed to toxic metal ions such as mercury and/or cadmium. The CC cation such as mercury or cadmium with high affinity. The present amino CC cation such as mercury or cadmium with high affinity. The present amino CC cation such as mercury ion binding chelon proteins of the invention. The invention is highly specific and binds divalent coff the invention of the invention. The invention is not of the invention.

CC of the invention of the heavy metal binding proteins termed chelons of the invention.

                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when lons from contaminated soil support, is useful for concentrating heavy metal ions from contaminated soil support. Is useful for concentrating heavy metal lons from contaminated environment waste streams or contaminated approach to a soil support, is useful for concentrating heavy metal lons from contaminated environment waste streams or contaminated approach to a soil of the invention of the invention of the contaminated approach heavy metal appears and including biological fluids. The nucleic acid, when recombinantly expressed in enteric bacteria (which are nontoxigenic and contaminated approach heavy metal approach heavy metal appears in a soil approach heavy metal appears in a soil appears in the soil of the contaminated appears in a soil appears in the 
                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                 acid sequence represents the Shigella flexneri wild type MerR protein of theinvention. This sequence was used in the methods of the invention for production of heavy metal binding proteins termed chelons.
                                                                                                                                                                                                                                                                                                                  nonpathogenic), is suitable for use in the in vivo sequestration and elimination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 20; 42pp; English.

CC recombinant DNA molecule comprising a sequence encoding a chelon protein CC which binds mercuric ions. The invention is useful for recombinantly CC producing a protein in a host-cell, by infecting or transforming a host CC cell capable of expressing a chelon coding sequence with a vector CC comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing CC the recombinant host cell under conditions, where DNA is expressed. CC The nucleic acid encoding the chelon protein is useful for binding CC divalent mercuric ions, to take up, sequester and concentrate the heavy CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC innshilised onto a solid support, is useful for concentrating heavy metal cons from contaminated environment waste streams or contaminated CC aqueous medium including biological fluids. The nucleic acid, when creombinantly expressed in enteric bacteria (which are nontoxigenic and CC elinination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The CC molecules of the invention are also useful in water treatment resins. CC The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present amino of synthetic cadmium/mercury ion binding chelon proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ХPD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      YNX OXX KW XXX

                                                                                                                                                         The present sequence represents a protein that is selective towards heavy metal ions. It is used in the construction of the sensor of the invention. The specification describes a metal ion-specific, affinity sensor that measures capacitance. The sensor comprises a piece of noble metal to which are bound groups that bind specifically to selected heavy metal ions. These groups are bound to a self-assembling monolayer that covers at least 90%, more preferably at least 99% of the noble equal surface. The noble metal surface. The noble metal is a rod or piece of insulating material (glass, quartz or silica) on which a noble metal is sputtered. The sensor is used for qualitative or quantitative detection of selected heavy metal ions in liquid samples, particularly of zinc, mercury, coadmium, copper and lead in e.g. environmental samples, medicines,

The invention relates to a method for displaying a polypeptide/protein on the invention relates to a method for displaying a polypeptide/protein on the guide of the bacteriophage particle. The attachment is via a disulfide bond the bacteriophage particle. The attachment is via a disulfide bond the polypeptide/protein to a unit of the protein coat of the protein coat. Displaying polypeptide/protein and a cysteine coat. Displaying polypeptide/protein on surface of the bacteriophage particle. A collection of the bacteriophage particle is useful for obtaining a polypeptide/protein having a desired property, the collection and/or selecting from a bacteriophage particle to particle to obtain a bacteriophage particle displaying a collection of bacteriophage particle displaying a collection of bacteriophage particles with the target of interest. The method further involves contacting a collection of bacteriophage particles with the target of interest by treating the complexes of target of interest and bacteriophages under reducing conditions. The methods easy creation and screening of large to bacteriophage particles with the target of interest conditions. The methods easy creation and screening of large bacteriophage particles.

Creamble invention relates to a nucleic acid encoding a adipose (ADP) compositions which regulates, causes or contributes to obesity in an committee of adp activity, adp antisense nucleic acids, expression committees, adp transgenic animals are useful in the diagnosis and contributed to obesity, adipositas, bulimia, wasting (cachexia), eating considers and/or disorders of body weight/body mass, weight loss due to disorders and/or disorders of body weight/body mass, weight loss due to cancer or infectious diseases, genetic disorders associated with hypogonadism, diabetes, Cushing's syndrome, induced the disorders, conjunctions, and anorexia nervosa. They are also useful for treating conditis, and anorexia nervosa. They are also useful for treating compositions are also useful for treating the storage diseases, and lipid storage diseases and for treating lipomas, and/or liposarcomas. The compositions are also useful for treating heart disease, hypertension, and infertility and for treating conditions associated with under weight constraint and munucodeficiency syndrome (AIDS) or cancer patients. The confidence is a peptide tag used in a fusion protein with an account of the confidence of the purification.

                                                                                                                                                                                                                                                                      AAW59211 and AAW59212 are ligands used in a method to assay binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptavidin mutants with higher binding affinity for peptide ligands - have mutation in amino acid region 44-53, used to isolate, purify or determine fusion proteins including these ligands
